Appendix K: Planning District Commission Data for 2017	75

Executive Summary

Local governments play a significant role in the lives of citizens and in the state's economy. The ability for a locality to provide services to their citizens depends on their capability to generate revenue from their own sources. A lack of revenue-generating capacity will lead to either a shrinking budget or a gap between revenues and expenditures, which is considered fiscal stress.

The Commission on Local Government (CLG) reports on the fiscal condition of Virginia's localities on an annual basis. The origin of the fiscal stress index can be traced to a report from the Joint Legislative Audit and Review Commission (JLARC) in 1984 in House Document 15. The fiscal stress index is a relative index where the statewide average equals 100. The calculated index is offered as a means to distribute state aid to the 95 counties and 38 cities in the Commonwealth.

The fiscal condition known as fiscal stress within this report is the aggregation of analyses on the comparative revenue capacity, revenue effort, and median household income for Virginia's cities and counties. Each of these analyses provides a basic overview of the computations, findings, trends, and annual changes for historic perspective. The report also contains several appendices of graphs, maps, and tables for providing additional details to the reader including regionalized data by GO Virginia Region and Planning District Commission. Please note this report does not include information on towns in the Commonwealth because it would be difficult to distinguish their revenues from counties as they share revenues.

It is important to note this report uses some of the City of Hopewell's FY2016 data because they have not sent their FY2017 "Transmittal" to the Virginia Auditor of Public Accounts at the time this report was produced.

The FY2017 fiscal stress report has been prepared by the CLG staff according to the guidelines provided by JLARC and is consistent with previous years' fiscal stress reports adopted by CLG. The major findings of the FY2017 fiscal stress report include:

- **Fiscal Stress**
 - The average stress value for Virginia's cities (103.10) is significantly greater than the average for its counties (98.95).
 - 71 (53.4%) localities, which is 81.6% of cities and 42.1% of counties are considered to be experiencing above average or high fiscal stress.
 - There are 23 high stressed localities and 22 of them are cities.
 - Since FY2016, only five localities improved their stress category while two localities declined.
- **Revenue Capacity per Capita**
 - Virginia's average annual revenue capacity per capita growth since 2008 is 2.23%.
 - 83 (62.4%) localities' average annual growth is below the statewide average since 2008.
 - 78 (58.6%) localities' average annual growth rate is less than 2% since 2008.
- **Revenue Effort**
 - 14 cities (36.8% of all cities) and 37 counties (38.9% of all counties) show an average annual positive increase since 2008. This equals 38.3% of all localities.
- **Median Household Income**
 - Average median household income growth from the period 2008-2017 is only 1.58%.
 - Since 2008 five localities have negative growth, two of which are cities.
 - 22 cities (57.9% of all cities) and 42 counties (44.2% of all counties) show an annual growth (2016-2016) below the state average.

Fiscal Stress

For a given year, the fiscal stress of a locality can be gauged through a statistical averaging of relative stress scores that are based upon the revenue capacity per capita, revenue effort, and median household income of Virginia's 95 counties and 38 cities. The fiscal stress index illustrates a locality's ability to generate additional local revenues from its current tax base relative to the rest of the Commonwealth. Revenue capacity is a computation of how much revenue a jurisdiction could generate if it taxed its population at statewide average rates. Revenue effort is a ratio of actual tax collections by a locality to its computed revenue capacity. Median household income represents the level at which exactly half of the households in a jurisdiction earn more and the other half earns less.

The index weighs all three variables evenly. For all three variables, a tally equivalent to the state average will yield a relative stress score of 100.¹ Therefore, a composite fiscal stress score of 100 would equate to average stress relative to the rest of the Commonwealth.² Composite scores above 100 indicate fiscal stress that is above the state average, while scores below 100 imply fiscal stress conditions that are lower than the state average.

Additionally, fiscal stress scores are divided into four categories: low, below average, above average, and high. The categories are based upon the standard deviation of fiscal stress scores throughout the state. Stress scores that are more than one standard deviation above the mean (which is always 100) would be placed into the high stress category, while scores more than one standard deviation below the mean would be classified as low stress. A score less than one standard deviation above the mean would characterize a jurisdiction experiencing above average stress, and a score less than one standard deviation below the mean would represent a jurisdiction experiencing below average stress. In the 2017 index, the standard deviation of fiscal stress scores was 3.71. Therefore, a score above 103.71 would fall into the high stress category, and a score below 96.29 would fall into the low stress category.

In the FY 2017 index, the average stress value for Virginia's cities (103.10) is significantly greater than the average for its counties (98.95). The distribution of index scores ranges from a low of 90.14 in Goochland County to a high of 107.74 in Emporia City. The highest stress score is computed as 19.5% higher than the lowest score. Of the 133 cities and counties in Virginia, 71 (53.4%) are considered to be experiencing above average or high fiscal stress. Of those 71 jurisdictions, 31 are cities and 40 are counties. Furthermore, the percentage of cities experiencing above average or high stress is 81.6% for FY 2017, while the corresponding percentage for counties is 42.1%. In addition, localities that are experiencing high stress are all cities. These statistics indicate that Virginia's cities are experiencing more of a financial burden than its counties.

¹ The average component score was changed to 100 from 55 in the FY2011 index.

² The average fiscal stress score was changed to 100 from 165 in the FY2011 index.

2017 Fiscal Stress Scores by Locality

(Alphabetic Order)

Locality	Stress	Rank	Class
Accomack County	100.44	64	Above Average

Revenue Capacity per Capita

Revenue capacity per capita measures how much tax revenue a locality could collect per person from its base if it used statewide average rates. There are five primary factors that are involved in the computation: true value of real estate, true value of public service corporation real estate, registered vehicles, local option sales tax receipts, and adjusted gross income. Statewide average rates are applied to all factors except for local option sales receipts to compute average tax estimates. The average tax estimates for all five factors are added together and then divided by the population of the jurisdiction. A locality with a revenue capacity per capita that is equal to the state average would have a score of 100 for this component of the computation.

The 2017 index illustrates a per capita revenue capacity range with a high of \$5,693.09 in Bath County and a low of \$967.08 in Radford City. Appendix A indicates that Bath County is an outlier in the sample, as the rest of the jurisdictions fall below \$4,710 per person. The average revenue capacity per capita in the Commonwealth is \$2,105.18. The average revenue capacity per capita for counties is \$2,191.90, and the average revenue capacity per person for cities is \$1,888.40. This comparison illustrates that county governments are able to generate more tax revenue per citizen than city governments.

When sorted by rank, it is clear that most jurisdictions within the Commonwealth realize a per capita revenue capacity figure between \$1,000 and \$2,000. Of the 133 jurisdictions, 68 fall into this category, which represents 51.1% of all Virginia's cities and counties. The median of revenue capacity per capita scores across the Commonwealth is \$1,972.96. These statistics, when compared to the entire range of values, indicate that most localities are closer to the low end of the range than the high end.

The average annual growth in revenue capacity per capita since 2008 throughout the Commonwealth is 2.23%.³ Of the 133 cities and counties in the Commonwealth, 83 (62.4% of all localities) are experiencing average annual growth below the statewide average. Of the 83 localities that are experiencing below average growth, 78 (58.6% of all jurisdictions) are growing at an average annual rate of less than 2% since 2008. On the other hand, three localities are seeing their average annual growth in revenue capacity per capita exceed 7%. Those localities are Brunswick County (9.12%), Dickenson County (7.90%), and Greensville County (7.63%).

³ For more information about average growth for revenue capacity, refer to Appendix H.

Revenue Effort

A locality's revenue effort is computed as its own-source revenue collections divided by its revenue capacity. The components of own-source revenue used by the Commission on Local Government for this computation are real estate taxes, public service corporation real estate taxes, personal property taxes, local option sales taxes, and other local source revenue. Data used for this exercise was taken from the Comparative Report of Local Government Revenue and Expenditures for FY 2017 published by the Auditor of Public Accounts. A locality that is collecting revenue at its computed capacity would receive a score of 100.

Revenue effort across the state ranges from a high of 1.7532 in Emporia City to a low of 0.4922 in Goochland County. The statewide average revenue effort in the 2017 index is 0.9294. In other words, on a statewide basis, Virginia localities are collecting almost \$0.9294 for every \$1.00 of revenue capacity. More enlightening is the effort computed for cities as compared to counties. On average, revenue effort of Virginia counties is 0.7637. On the other hand, Virginia cities have an average effort of 1.3436. In other words, cities are collecting above their computed capacities relative to the state average, while counties are collecting far below theirs. This can be seen graphically in the first graph in Appendix A. To the right of 1.0 on the revenue effort scale are mostly cities, while counties lie mostly to the left. Revenue effort of all cities in the commonwealth, except Poquoson City is below the statewide average.

Annual percentage change in revenue effort since 2008 on average is -0.14% across the 133 jurisdictions.⁴ This indicates that localities are collecting 0.14% less of their capacity per year since 2008. In general, lower revenue effort calculations lead to lower fiscal stress. Generally, there are two reasons for a change in revenue effort: a change in tax collections or a change in revenue capacity. As described earlier, revenue capacity is a function of five different factors; therefore, a change to one of them will affect revenue effort. For example, if the true value of real estate in a locality were to decrease, revenue capacity would also decrease and revenue effort would increase, assuming all other components in this calculation are constant.

Of the 133 jurisdictions, 51 (38.3%) show an average annual positive increase in revenue effort in the last 10 years. Those 51 localities are comprised of 14 cities (36.8% of all cities) and 37 counties (38.9% of all counties). It is important to note that all localities (nine) that comprise the GOVA Region 7 (Northern Virginia) are among these 51 localities.⁵

⁴ For more information regarding the change in revenue effort over time, refer to Appendix I.

⁵ For information about the localities that fall within the GOVA Region, refer to Appendix C.

Median Household Income

A jurisdiction's median household income represents the point at which half of households earn a higher income and the other half earns a lower income. It is important to note that this does not represent average household income in the locality. Median household income replaced adjusted gross income as a stress score component in the 2009 index. This component of the fiscal stress computation is taken from the U.S. Census Bureau.

In the 2017 index, median household income throughout the state ranges from a high of \$136,191 in Loudoun County to a low of \$32,152 in Lee County. The average household income in the Commonwealth used in the stress computation is \$57,947.⁶ Of the 133 jurisdictions, 86 (64.7%) report a median household income that is lower than the average. Of those 86 localities, 29 are cities and 57 are counties. The 29 cities below the average represent 76.3% of all cities in the Commonwealth. The 57 counties represent 60.0% of all counties in the state. As a point of reference, the average median household income in Virginia in the 2012 index was \$50,809. Cities and Counties that reported a median household income lower than the average in 2012 totaled 85 (63.9%). Cities below the average equaled 28 (73.7%) and counties below the average equated 57 (60.0%). This comparison illustrates that the number of cities and counties below the average for median household income has been changed only for Virginia Cities from 2012 to 2017. However, the average of median household income since 2012 increased by 14.0%.

Average median household income growth from the period 2008-2017 is 1.58%.⁷ Of the 133 jurisdictions, 64 (48.1%) have annual growth below the state average. Of those 64 localities, 22 are cities (57.9% of all cities), and 42 are counties (42.2% of all counties).

⁶ The index computes a statewide barometer by taking the average of the median household incomes of all 133 cities and counties. The true median household income of Virginia in 2017 was \$71,518, as reported by the U.S. Census Bureau.

⁷ For more information about changes in median household income over time, refer to Appendix J.

Computation Methodology

As described earlier in the report, the fiscal stress index is comprised of three factors: revenue capacity per capita, revenue effort, and median household income. From these statistics, individual stress scores are computed. Finally, the three component stress scores are averaged together to form a composite.

Revenue Capacity per Capita

The most difficult of the factors to compute is revenue capacity per capita. The five taxes that comprise the revenue capacity calculation are real estate taxes, public service corporation (PSC) property taxes, personal property taxes, local sales taxes, and other local-source revenues.⁸ Examples of taxes that fall into the “other” category include but are not limited to business license taxes, meals taxes, and lodging taxes.

Before any meaningful analysis can be done, statewide average tax rates must be computed. These average rates are applied to each jurisdiction to determine the amount that could be collected in tax revenues using average statewide rates. The statewide rates are computed as follows:

- 1) $\frac{\text{Statewide Real Estate Tax Revenue}}{\text{Statewide Real Property Value}} = \text{Statewide Real Estate Tax Rate}$
- 2) $\frac{\text{Statewide PSC Property Tax Revenue}}{\text{Statewide PSC Property Value}} = \text{Statewide PSC Property Tax Rate}$
- 3) $\frac{\text{Statewide Personal Property Tax Revenue}}{\text{Statewide Registered Vehicles}^9} = \text{Statewide Personal Property Tax Rate}$
- 4) $\frac{\text{Statewide Other Local Tax Revenue}}{\text{Statewide Adjusted Gross Income}^{10}} = \text{Statewide "Other" Tax Rate}$

Note: A statewide average rate for local option sales taxes is not required for the computation.

Once statewide average tax rates are computed, revenue capacity per capita is computed for each jurisdiction as follows:

$$\begin{aligned} & (\text{True Value of Real Property} \times \text{Statewide Real Estate Tax Rate}) \\ & + (\text{True Value of PSC Property} \times \text{Statewide PSC Property Tax Rate}) \\ & + (\text{Registered Vehicles} \times \text{Statewide Personal Property Tax Rate}) \\ & + (\text{Adjusted Gross Income} \times \text{Statewide "Other" Tax Rate}) \\ & + \text{Local Sales Tax Revenues} \end{aligned}$$

Population

Once revenue capacity per capita has been computed for all cities and counties, it is possible to generate relative stress scores. A jurisdiction’s revenue capacity per capita stress score is calculated as follows:

$$\left(\left(\left(\frac{((\text{Revenue Capacity Per Capita}) - \mu(\text{Revenue Capacity Per Capita}))}{\sigma(\text{Revenue Capacity Per Capita})} \right) \times (-5) \right) + 100 \right)$$

μ = statewide average; σ = standard deviation

⁸ The fiscal stress index is only concerned with own-source revenues. Therefore, payments in lieu of taxes (PILOT) for enterprise activities and revenue sharing payments are omitted from the calculation. That data can be found on a locality’s Form 200 submission to the Auditor of Public Accounts (APA).

⁹ Registered vehicles are reported by the Department of Motor Vehicles.

¹⁰ Adjusted Gross Income is reported by the Department of Taxation.

Revenue Effort

Revenue effort is the ratio of actual taxes collected divided by revenue capacity. In order to appropriately compare to the revenue capacity figures, effort must be computed as a per capita figure as well. Revenue collections per capita are computed as follows:

$$\begin{aligned} & (\text{Real Estate Tax Revenue}) \\ & + (\text{PSC property Tax Revenue}) \\ & + (\text{Personal Property Tax Revenue}) \\ & + (\text{Local Sales Tax Revenue}) \\ & + (\text{Other Local Taxes}) \end{aligned}$$

Population

The calculation for revenue effort is as follows:

$$\frac{\text{Revenue Collections per Capita}}{\text{Revenue Capacity per Capita}} = \text{Revenue Effort}$$

A relative stress score for revenue effort is computed as follows:

$$\left(\left(\left(\frac{((\text{Revenue Effort}) - \mu(\text{Revenue Effort}))}{\sigma(\text{Revenue Effort})} \right) \times 5 \right) + 100 \right)$$

μ = statewide average; σ = standard deviation

Median Household Income

The stress score for median household income is the simplest of the three. After the raw data is collected, one can immediately calculate stress scores for each jurisdiction using the following calculation:

$$\left(\left(\left(\frac{((\text{Median Household Income}) - \mu(\text{Median Household Income}))}{\sigma(\text{Median Household Income})} \right) \times (-5) \right) + 100 \right)$$

μ = statewide average; σ = standard deviation

Fiscal Stress

To compute the composite fiscal stress index, all three component stress scores are averaged together as follows:

$$(Revenue Capacity per Capita Stress Score + Revenue Effort Stress Score + Median Household Income Stress Score) / 3$$

Because all of the components of the fiscal stress index are relative to state averages, the composite fiscal stress index is as well. In strong and weak economic conditions, 100 will represent average stress.

Computational Exhibits

The Commission offers computational exhibits of the calculations for each locality within the index. To access that information, please visit the following website:

<https://www.dhcd.virginia.gov/fiscal-stress>

Appendix A

Revenue Capacity per Capita vs. Revenue Effort

Appendix A: Revenue Capacity per Capita vs. Revenue Effort

Presented below is a scatter graph of the 133 localities' revenue capacity per capita and revenue effort computations. The horizontal axis of the graph measures the revenue effort and vertical axis measures the revenue capacity of localities. Graphical presentation of the data indicates as the revenue capacity of the localities declines the revenue effort of the localities increases, meaning there is a negative correlation between the value of a jurisdiction's tax base and its collection efforts. The graph also compares the revenue capacity and collection effort between counties and cities. Most of the cities are plotted in the far right of the horizontal axis and far lower in the vertical axis of the graph, meaning most cities have high revenue collection effort with low revenue capacity. In contrast, most of the counties are plotted in the far left of the horizontal axis and upper lower to high of the vertical axis of the graph, meaning most counties have lower revenue collection effort with high revenue capacity. Average revenue capacity per capita and average revenue effort for counties is \$2,191.90 and 0.7637, respectively. Whereas, the cities' average revenue capacity per capita and average revenue effort is \$1,888.40 and 1.3436, respectively. The counties' average revenue capacity per capita is 16.1% higher than cities, but the cities' average revenue effort is 75.9% higher than the counties.

The following graph has been presented to show the relationship between the average revenue capacity per capita and the average revenue effort for all localities over the period of FY2008 – FY2017. The revenue capacity per capita has been indexed with 2008 revenue capacity per capita for meaningful graphical presentation of the data. The graph indicates the negative correlation between revenue capacity per capita and revenue effort of localities. This means as revenue capacity per capita increases the revenue effort of the localities decreases, which is also consistent with the graphical presentation on previous page.

Appendix B

Revenue Capacity per Capita vs. Median Household Income

Appendix B: Revenue Capacity vs. Median Household Income

Presented below is a scatter graph of the 133 localities' revenue capacity per capita and median household income. The data seems to indicate a positive correlation between the two data series. This finding is in agreement with the general principal that higher earners have more from which to collect taxes. Variation seems to be primarily linked to a locality's reliance on real estate taxes. For example, Bath County and Falls Church City are outliers mostly because Falls Church City generates highest amount of real estate taxes on a per capita basis, and Bath County generate the second highest amount of public service corporation taxes on a per capita basis.

Rank Scores: 1 = Highest Stress, 133 = Lowest Stress

NOTE: Localities in the index reduced from 134 to 133 in FY14 when the City of Bedford reverted to town status.

* 2010 data was not used in Fiscal Stress Index

^ Adjusted Gross Income was used in the Fiscal Stress Index until it was replaced by Median Household Income in the 2009 index
